What is ENF?

- Electrical Network Frequency (ENF)
- 50Hz for Europe; 60Hz for America and parts of Asia
- Fluctuations in frequency
 - Unique
 - Grid-wide
 - Possibility of fingerprinting/timestamping
- ENF in audio
 - Devices generate mains hum
 - Hum can be recorded to deduce ENF

Why use ENF?

- Imagine adversary manipulating a recording
 - False Frame Injection attack
 - Deletion of metadata
- ENF allows timestamping recordings

ENF measured on 04-06-2020

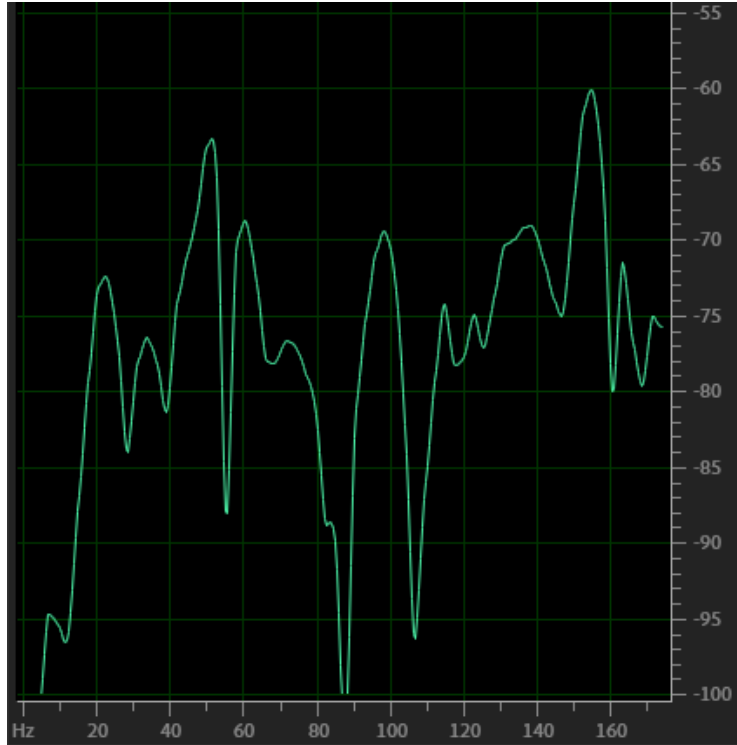

Retrieving ENF from audio

ENF in video

- Studies have shown possibility to retrieve ENF from video
- Aimed to reproduce these studies
- Research how properties of video affect obtaining ENF

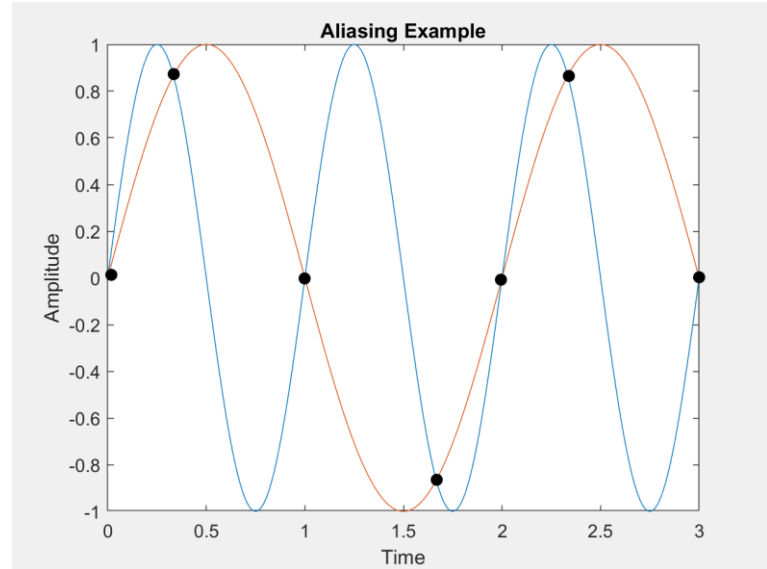

What requirements are there to correctly timestamp a video recording using ENF data?

Is it possible to extract ENF data from video?

How do the properties of a video affect the presence of ENF data in a recording?

Sampling rate

- Nyquist-Shannon sampling theorem
- Nyquist sampling rate

Camera frame rate

- 25 or 30 frames per second
- Sampling rate too low
- High speed cameras

Sampling target

- Fluorescent light
- Incandescent light bulb
- Photosensitive sensor

CMOS Sensors

- Per row basis
- Rolling shutter effect
- Increases sampling rate

- "SmarterEveryDay"

Methodology

- Gathering a baseline of ENF data
- Three methods to do so:
 - Find online source that provides data
 - Connect power outlet to audio recorder
 - Use audio of a recording and verify against database

Test environment

- Recreate test environment from R. Garg's research
- Light up a white wall with light
 - Fluorescent light
 - Record lit wall for long period of time
- Split up recording into multiple parts

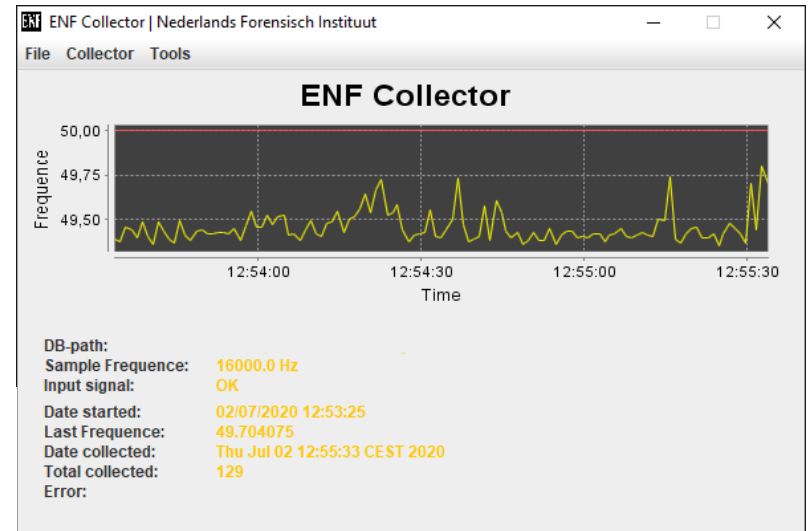

Filtering

- Blur
- High pass filter

Results

- ENF from audio
- Data from CMOS

Discussion

- Time constraints
- Filtering
- CMOS
- Prevention

Conclusion

- Using CMOS sensors shows promising results
- We theorise it should be possible
- Specific conditions are needed

Future work

- Extracting ENF data from CMOS sensor video
- Super pixel based dynamic approach
- Combine footage
